# School of Geography and Geology McMaster University

Advanced Topics in Spatial Statistics

# **Spatially Continuous Data III & IV**

#### This session:

#### Spatially Continuous Data

- Exploration: Second Order Properties
  - o Covariogram, correlogram and variogram
- Modeling spatially continuous data
  - Trend surface analysis

# Spatially continuous data: Visualization of first order effects

#### Visualization

- Symbol maps
- Indicator maps
- Grayscale maps
- Proportional symbol maps
- Colors
- ...

# Spatially continuous data: Exploration of first order effects

- Exploration
  - Moving averages
  - Kernel estimation
  - Tesselations
    - Gradient maps
    - Contour maps

#### Second order effects: Smaller scale variation

- Point patterns
  - Nearest-neighbor distance analysis
- Spatially continuous data
  - Covariation of neighboring observations

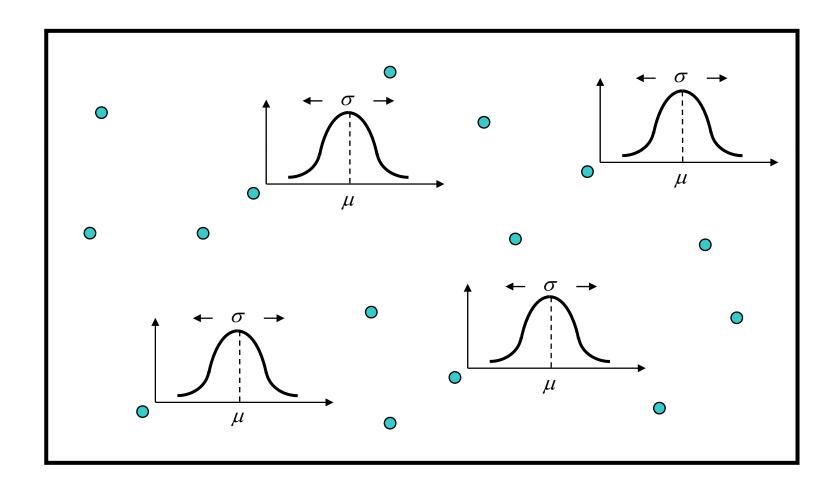

#### **Definitions**

Mean and variance of a spatial random variable

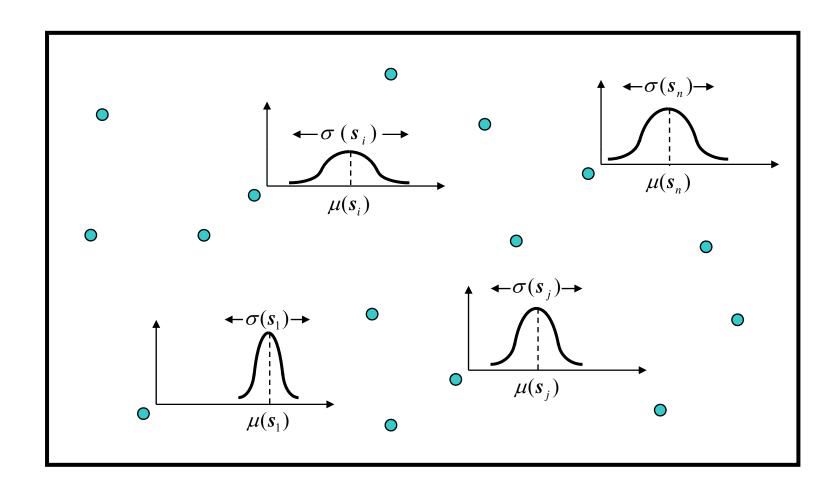

$$E[Y(s)] = \mu(s)$$

$$VAR[Y(s)] = \sigma^2(s)$$

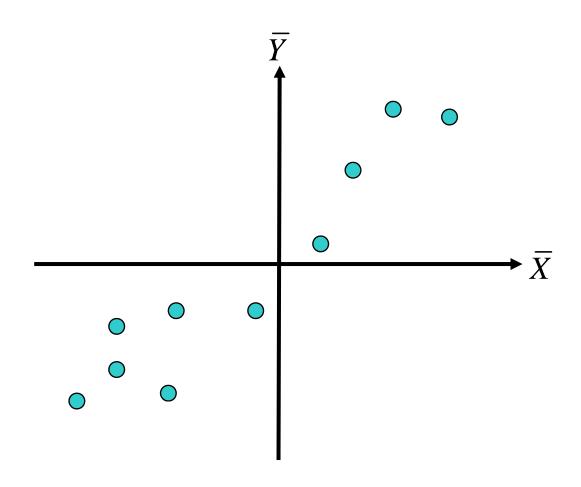

# Mean and variance in a stationary process

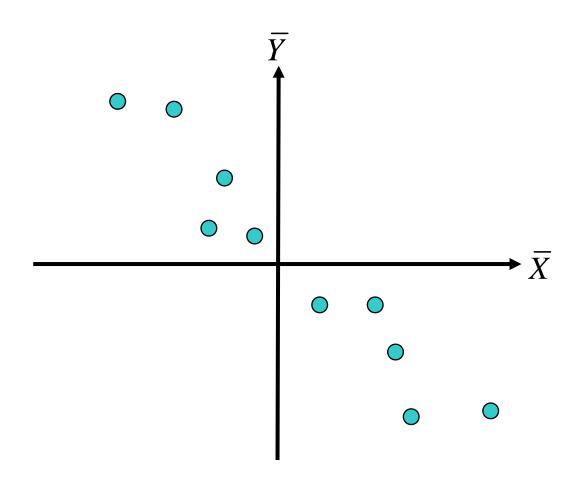

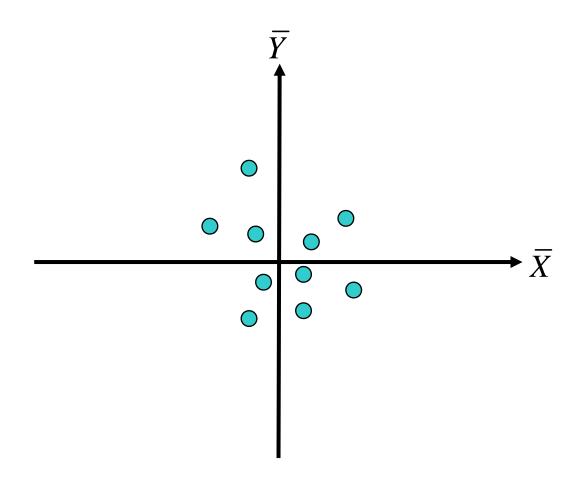

# Mean and variance of a spatial random variable

$$C_{XY} = \frac{1}{n} \sum_{i=1}^{n} (X_i - \overline{X})(Y_i - \overline{Y})$$

#### Correlation of the process

Correlation of the process between X and

$$\rho(X,Y) = \frac{C_{XY}}{\sigma_X \sigma_Y}$$

#### Auto-covariance of the process

o Covariance of the process between  $s_i$  and  $s_j$ 

$$C(s_i, s_j) = E[(Y(s_i) - \mu(s_i))(Y(s_i) - \mu(s_i))]$$

$$C(\mathbf{s}_i, \mathbf{s}_i) = \sigma^2(\mathbf{s}_i)$$

### Covariance of a stationary process

Covariance of the process between  $s_i$  and
  $s_j$  depends on distance and direction only

$$C(s_i, s_j) = C(s_i - s_i) = C(h)$$

Correlation

$$\rho(\mathbf{s}_i, \mathbf{s}_j) = \frac{C(\mathbf{h})}{\sigma^2}$$

#### Auto-covariance at various spatial lags

$$y_1 = 8$$

$$y_2 = 9$$

$$y_3 = 8$$

$$y_1=8$$
  $y_2=9$   $y_3=8$   $y_4=7$   $y_5=6$   $y_6=7$   $y_7=8$   $y_8=9$ 

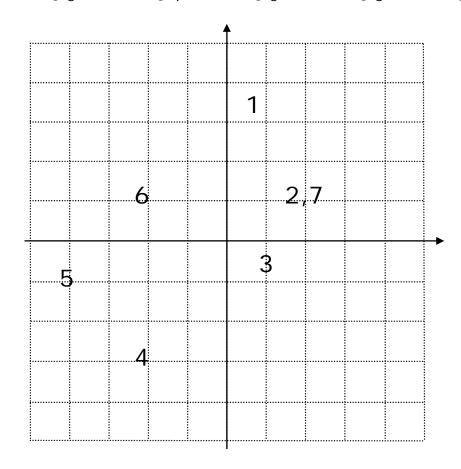

$$y_5 = 6$$

$$y_6 = 7$$

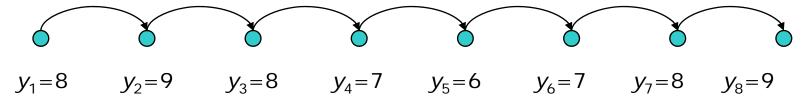

$$y_7 = 8$$

$$y_8 = 9$$

$$\bar{y}$$
=7.75

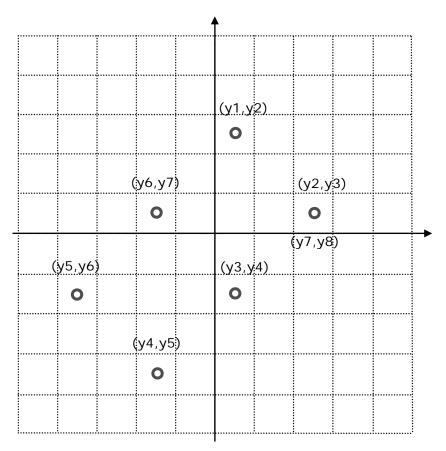

#### Auto-covariance at various spatial lags

 $\bar{y} = 7.75$ 

h=1

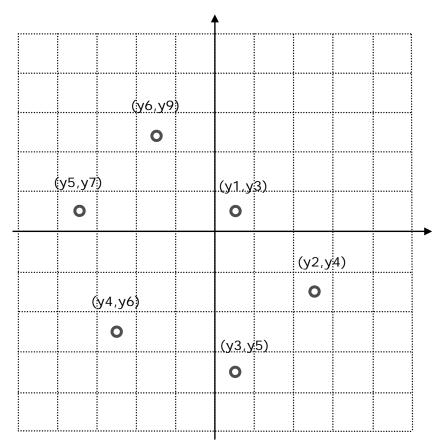

#### Auto-covariance at various spatial lags

 $\bar{y} = 7.75$ 

h=2

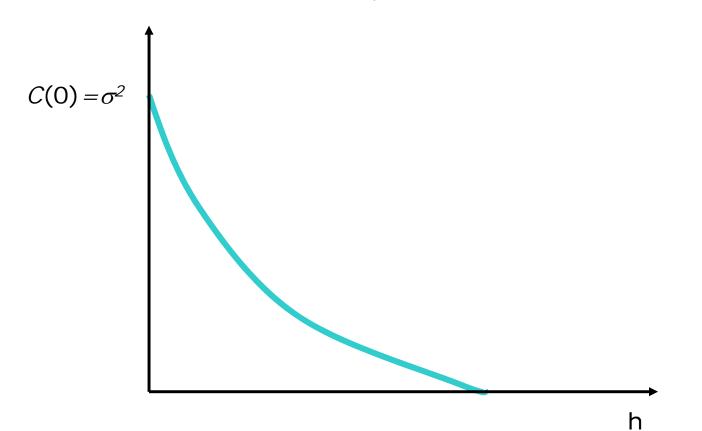

### Covariogram

 A plot of the covariance of the process at various spatial lags

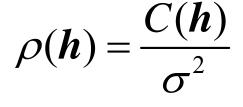

$$C(h) = \frac{1}{n(h)} \sum_{s_i - s_j = h} (y_i - \overline{y})(y_j - \overline{y})$$

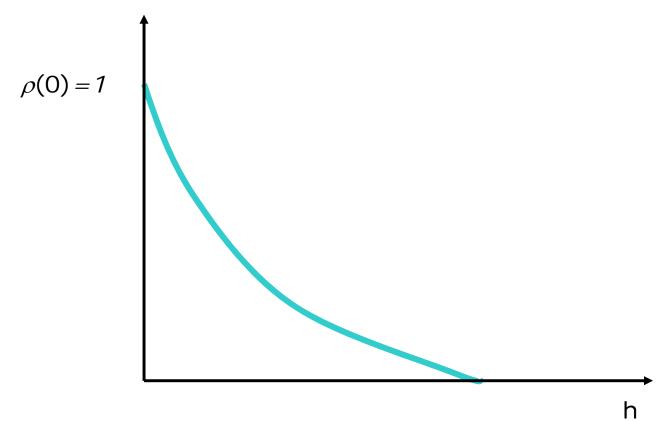

## Covariogram

$$C(\boldsymbol{h}) = \frac{1}{n(\boldsymbol{h})} \sum_{s_i - s_j = \boldsymbol{h}} (y_i - \overline{y})(y_j - \overline{y})$$

# Correlogram

#### Variogram

Intrinsic stationarity (weaker assumption)

$$E[Y(s+h)-Y(s)]=0$$

$$VAR[Y(s+h)-Y(s)] = 2\gamma(h)$$

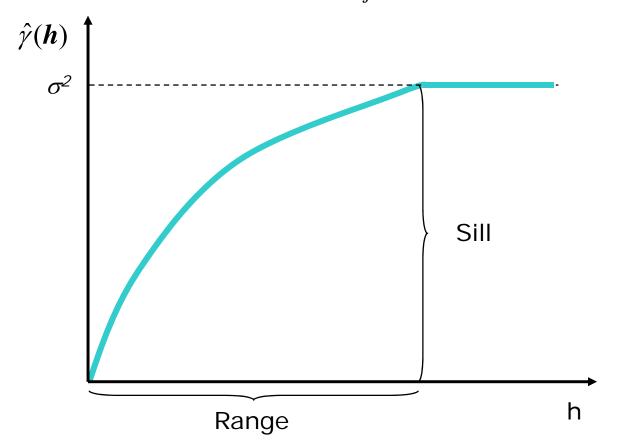

### Variogram

Intrinsic stationarity

$$2\hat{\gamma}(\boldsymbol{h}) = \frac{1}{n(\boldsymbol{h})} \sum_{s_i - s_j = \boldsymbol{h}} (y_i - y_j)^2$$

## Variogram

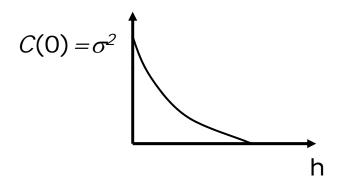

$$\hat{\gamma}(\boldsymbol{h}) = \frac{1}{2n(\boldsymbol{h})} \sum_{s_i - s_j = \boldsymbol{h}} (y_i - y_j)^2$$

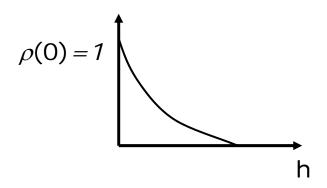

#### Covariogram, correlogram, variogram

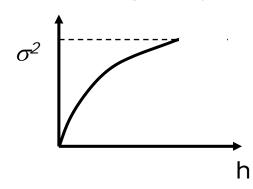

Covariogram *C*(*h*)

Correlogram

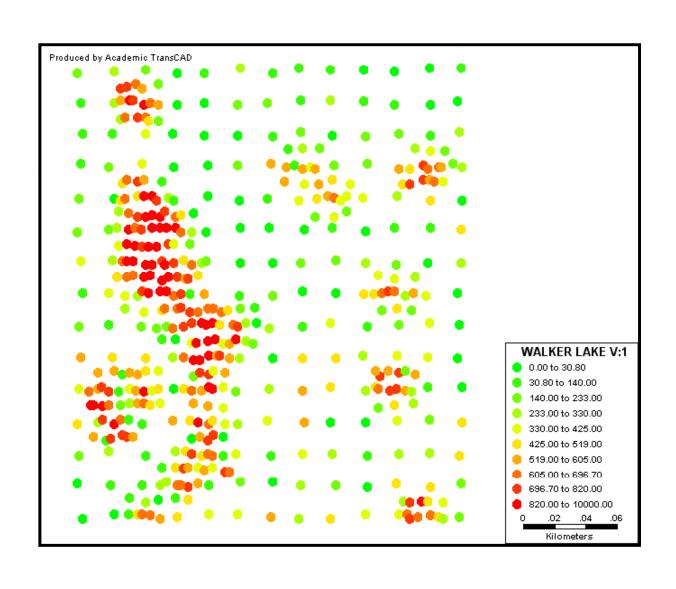

Variogram  $\hat{\gamma}(h)$ 

$$\hat{\gamma}(\boldsymbol{h}) = \sigma^2 - C(\boldsymbol{h})$$

#### Example of variogram

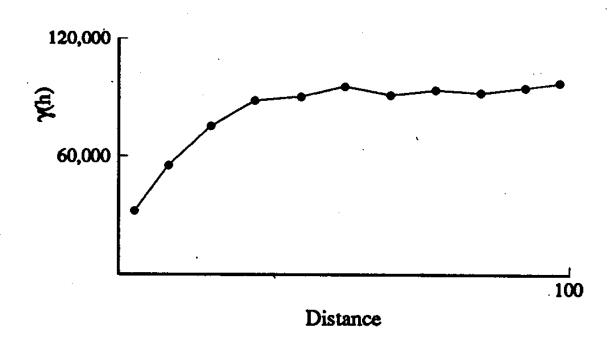

Figure 7.3 Omnidirectional sample variogram for V with a 10 m lag.

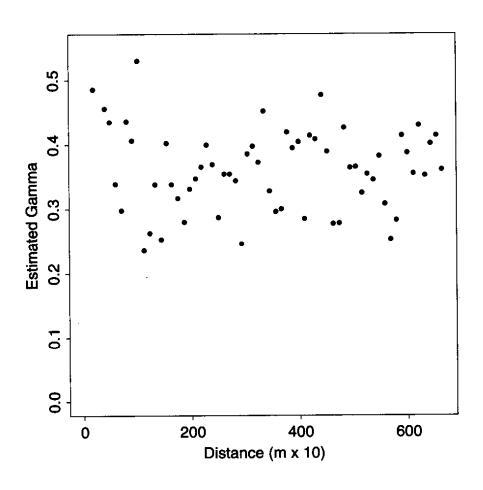

Fig. 5.11 Sample variogram for logarithms of radon levels

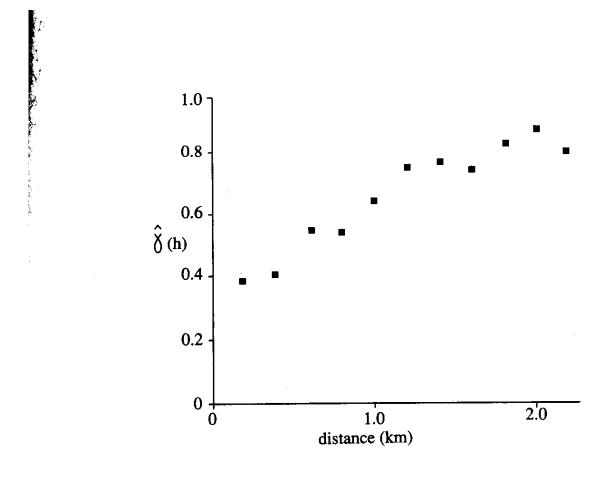

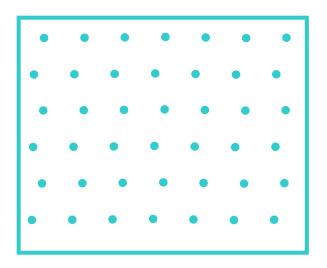

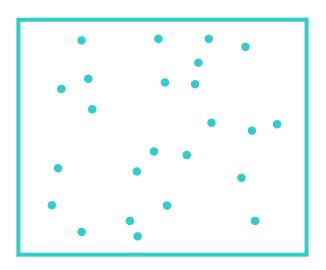

Fig. 5.12 Sample variogram for logarithms of nickel concentrations on north Vancouver Island

Selection of spatial lags h

- Selection of spatial lags h
  - Number of point pairs
  - Few points, low reliability

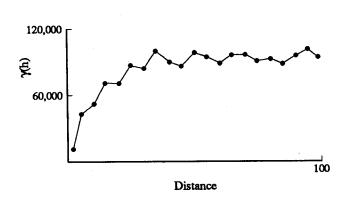

Figure 7.2 Omnidirectional sample variogram for V with a 5 m lag.

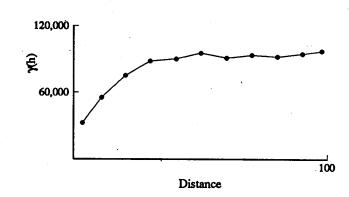

Figure 7.3 Omnidirectional sample variogram for V with a 10 m lag.

- Selection of spatial lags h
  - Number of point pairs
  - Few points, low reliability

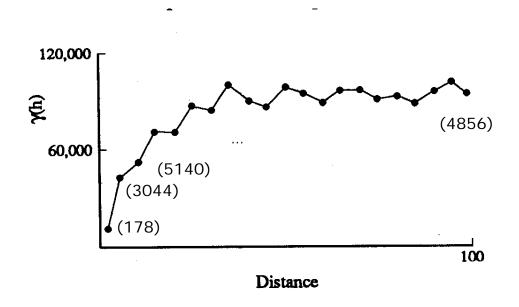

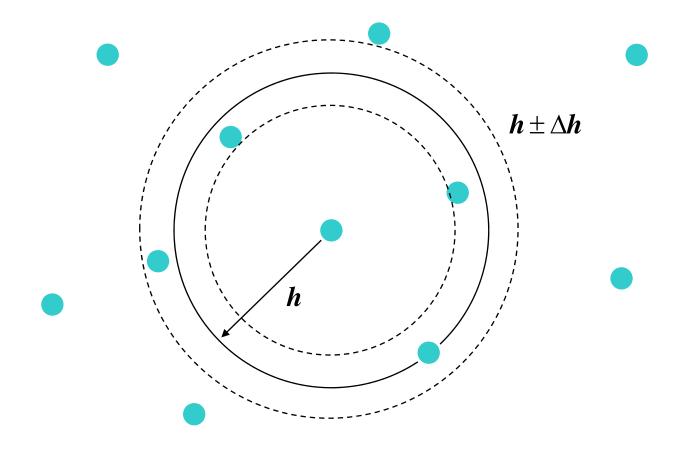

Figure 7.2 Omnidirectional sample variogram for V with a 5 m lag.

Selection of spatial lags h

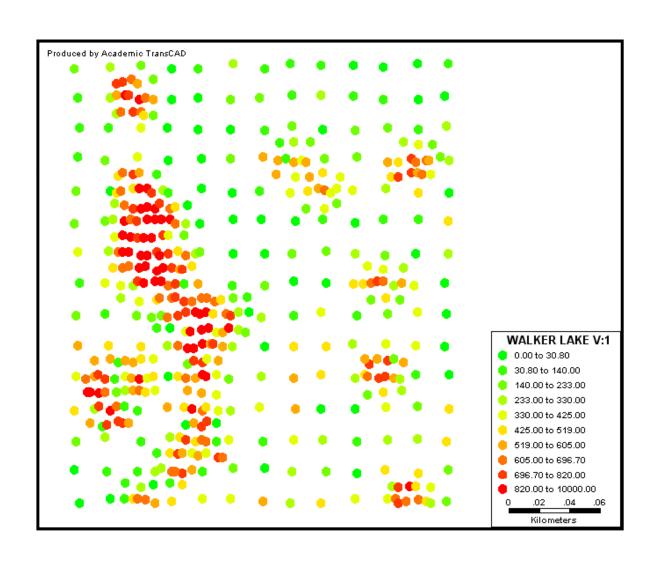

## Some Important Issues: Isotropy

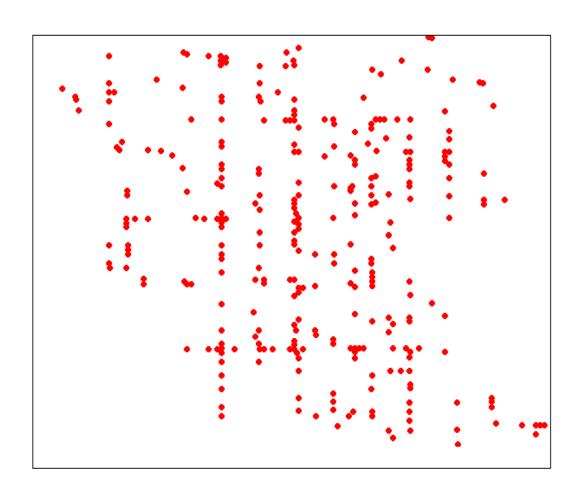

- The process depends only on distance, not direction
  - Useful preliminary assumption
    - Omnidirectional variogram
    - Cleaner relationships
  - Must be checked against the data

- Anisotropy
  - Isaaks and Srivastava (1989) Applied Geostatistics, chapters 7 and 16

# Anisotropy: Walker Lake

# Anisotropy: Street Dust

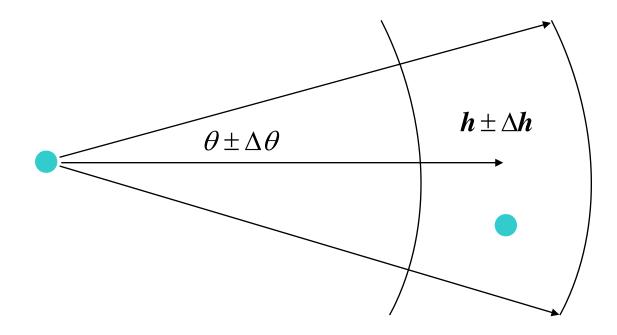

## Anisotropy: Street Dust

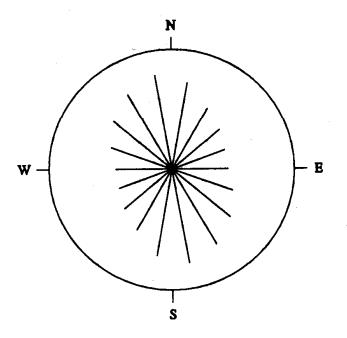

## Anisotropy

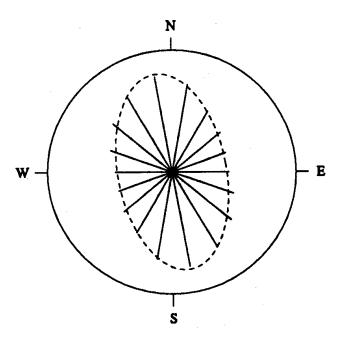

- Directional variogram
  - Selection of spatial lags h

# **Directional Variograms**

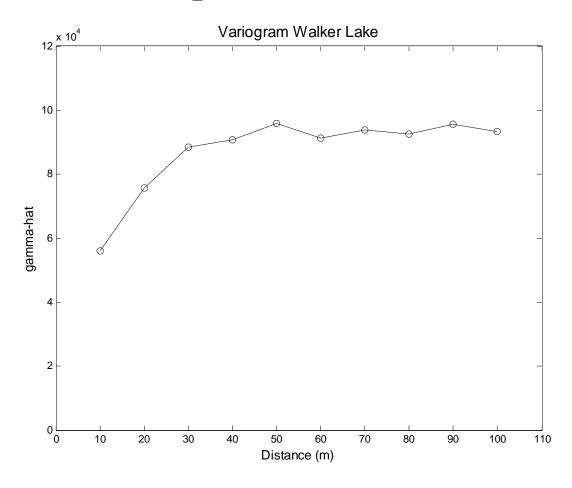

#### Walker Lake

## **Describing Spatial Structure**

#### Empirical Variogram

- A theoretical model that fits the empirical variogram
- The variogram model should produce a covariance matrix that is:
  - Symmetric

$$C(\mathbf{s}_i, \mathbf{s}_j) = C(\mathbf{s}_j, \mathbf{s}_i)$$

Non-negative definite

- Spherical
- Exponential
- Gaussian
- o Linear
- o Bessel
- O ...

#### Spherical

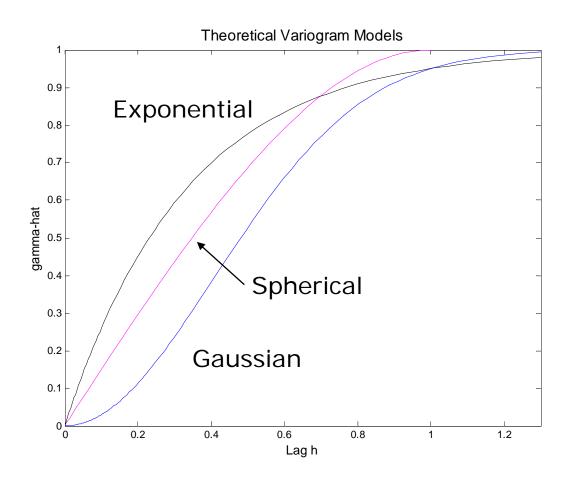

$$\gamma(h) = \begin{cases} \sigma^2 \left( \frac{3h}{2r} - \frac{h^3}{2r^3} \right) & \text{for } h \le r \\ \sigma^2 & \text{otherwise} \end{cases}$$

Exponential

$$\gamma(h) = \sigma^2 \left( 1 - e^{-3h/r} \right)$$

Gaussian

$$\gamma(h) = \sigma^2 \left( 1 - e^{-3h^2/r^2} \right)$$

Spherical with nugget effect

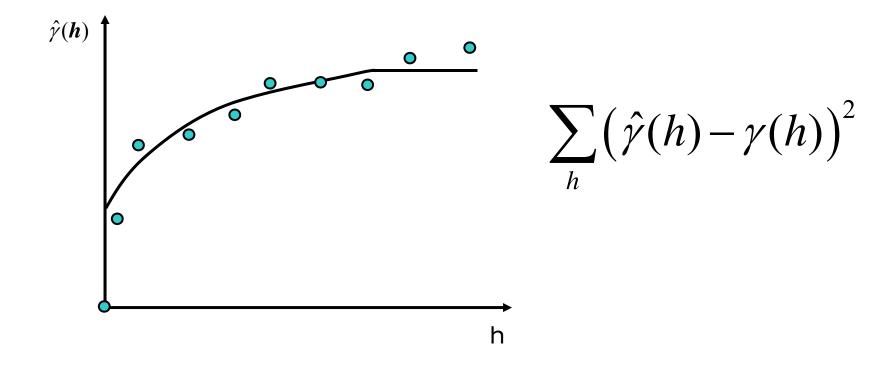

$$\gamma(h) = \begin{cases} a + (\sigma^2 - a) \left( \frac{3h}{2r} - \frac{h^3}{2r^3} \right) & \text{for } 0 < h \le r \\ 0 & \text{for } h = 0 \\ \sigma^2 & \text{otherwise} \end{cases}$$

Exponential with nugget effect

$$\gamma(h) = \begin{cases} \sigma^2 \left( 1 - e^{-3h/r} \right) & \text{for } h > 0 \\ 0 & \text{for } h = 0 \end{cases}$$

- Relative nugget effect
  - The ratio of the nugget to the sill  $(a/\sigma^2)$
  - Sometimes expressed as percentage
  - A relative nugget of 100% indicates total absence of spatial autocorrelation

Fitting a theoretical model: Least squares

#### Second Order Effects

- The covariogram, correlogram and variogram and exploratory tools to study second order properties of spatially continuous data
- The variogram is more resistant to departures from the assumptions
- These tools are important elements in modeling spatially continuous data

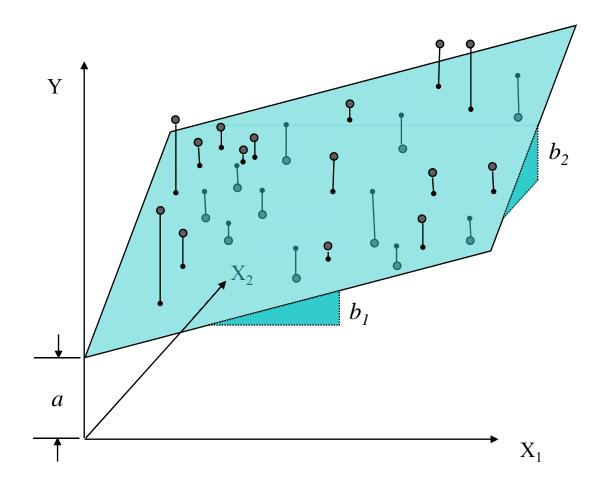

#### First AND/OR Second Order Effects

- Variogram analysis very effective in the presence of pure second order effects
- Effect of a trend on variogram analysis
- De-trending the data
- Trend surface analysis

#### Modeling Spatially Continuous Data

- Trend Surface Analysis
  - A method to model the first order component of a spatial process
  - Multiple regression analysis using the coordinates of the points as "explanatory" variables

# Multiple Regression Analysis

## Trend Surface Analysis

$$z_i = b_1 + x_i b_2 + y_i b_3 + e_i$$

- z: dependent variable
- $b_1$ ,  $b_2$ ,  $b_3$ : regression parameters
- x , y: coordinates of point i

# Regression Analysis: Matrix Notation

$$z_{1} = b_{1} + x_{1}b_{2} + y_{1}b_{3} + e_{1}$$

$$z_{2} = b_{1} + x_{2}b_{2} + y_{2}b_{3} + e_{2}$$

$$\vdots$$

$$z_{n} = b_{1} + x_{n}b_{2} + y_{n}b_{3} + e_{n}$$

# Regression Analysis: Matrix Notation

$$\begin{bmatrix} z_1 \\ z_2 \\ \vdots \\ z_n \end{bmatrix} = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ \vdots & \vdots & \vdots \\ 1 & x_n & y_n \end{bmatrix} \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix} + \begin{bmatrix} e_1 \\ e_2 \\ \vdots \\ e_n \end{bmatrix}$$

# Regression Analysis: Matrix Notation

$$\begin{bmatrix}
z_1 \\
z_2 \\
\vdots \\
z_n
\end{bmatrix} = \begin{bmatrix}
1 & x_1 & y_1 \\
1 & x_2 & y_2 \\
\vdots & \vdots & \vdots \\
1 & x_n & y_n
\end{bmatrix} \begin{bmatrix}
b_1 \\
b_2 \\
b_3
\end{bmatrix} + \begin{bmatrix}
e_1 \\
e_2 \\
\vdots \\
e_n
\end{bmatrix}$$

## Regression Analysis: Assumptions

Error terms

## Regression Analysis: Assumptions

- o Error terms
  - Expected (mean) value = 0

$$E[e] = 0$$

## Regression Analysis: Assumptions

- o Error terms
  - Constant variance
  - Independent

$$E[ee'] = \mathbf{C} = \begin{bmatrix} \sigma^2 & 0 & 0 \\ \sigma^2 & 0 & 0 \\ 0 & \sigma^2 & 0 \\ 0 & 0 & \sigma^2 \end{bmatrix} = \sigma^2 \begin{bmatrix} 1 & 0 & 0 \\ 1 & 1 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \sigma^2 \mathbf{I}$$

## Regression Analysis: Estimation

Parameters

$$\hat{\boldsymbol{b}} = \left(\mathbf{X}^T \mathbf{X}\right)^{-1} \mathbf{X}^T \mathbf{Z}$$

Variance

$$\hat{\sigma}^2 = \frac{1}{n-k} \left( \mathbf{Z} - \mathbf{X}^T \hat{\boldsymbol{b}} \right)^T \left( \mathbf{Z} - \mathbf{X}^T \hat{\boldsymbol{b}} \right)$$
